

ABSTRACT

A food product and method of making the same are disclosed. The food product is preferably made of a processed Sorghum grain, and preferably from hybrids of Milo. The grain is subjected to decortication and extrusion. Additives may be provided to 5 flavor or otherwise nutritionally enhance the processed Milo. The additives are added prior to extrusion. The food product may be made from other grains or tubers by removing the starch and then using the starch to extrude the food product. A final food product may be achieved by further processing of the extruded grain. Further processing may include molding, baking, or pelletizing.
